INTERNATIONAL **PROPERTY MEASUREMENT STANDARDS**

IPMS Office Buildings

The adoption of the IPMS ensures that property assets are measured in a consistent and transparent manner which in turn gives greater confidence in the data produced.

Carter Jonas

The International Property Management Standards Coalition (IPMSC) was formed in May 2013. It was acknowledged that the way property assets were measured could vary greatly across different markets and regions and this made it difficult to make accurate comparisons. The IMPSC was created with the aim of producing an internationally adopted standard for the measurement of buildings.

The first standard IPMS - Office Buildings was published in November 2014 with three further standards for IPMS Residential, IPMS Industrial and IPMS Retail subsequently published.

IPMS & RICS

In January 2018, the RICS published Property Measurement Professional Statement, 2nd edition. This professional statement was updated to reflect the first two IPMS standards (IPMS - Office and IPMS - Residential) and will be updated as additional standards are published. It sets out the requirements of practice for RICS Members and firms regulated by RICS and makes the use of IPMS a mandatory requirement unless specific reasons for departure from the IPMS standard can be documented.

THE STANDARDS

The IPMS standards comprise three main measurement classifications:

IPMS 1 The sum of the areas of each floor level of a building measured to the outer perimeter of external construction features and reported on a floor-by-floor basis.

The definition of IPMS 1 is the same for all property types and equates closely with gross external area (GEA)

Reported area measurements will include

- Balconies
- Covered galleries
- Roof terraces

but should exclude:

- Open light wells or the upper level voids of an atrium
- · Open external stairways that are not an integral part of the building, e.g. fire escapes
- Ground levels not fully enclosed such as patios, car parking and refuse areas.

IPMS 2 - OFFICE The sum of the areas of each floor level of an office building measured to the internal dominant face reported on a component-by-component basis for each floor of a building

IPMS 2 - Office is used to measure the interior area and categorise the use of space in an office building. IMPS 2 equates closely to gross internal area (GIA)

Reported measurements include all internal walls, columns, and walkways between separate buildings available for direct or indirect use. Included features should be measured to their inner face and stated separately.

Excluded areas are the same as IPMS 1 however these components may be measured and stated separately.

INTERNATIONAL PROPERTY MEASUREMENT STANDARDS

IPMS Office Buildings

The adoption of the IPMS ensures that property assets are measured in a consistent and transparent manner which in turn gives greater confidence in the data produced.

INTERNAL DOMINANT FACE

Internal dominant face was a new concept in many markets and is key to consistent measurement within IPMS.

The internal dominant face (IDF) is the inside finished surface comprising more than 50% of the floor to ceiling height for each IDF wall section.

If there is no internal dominant face, because no face in an IDF wall section exceeds 50%, or if the internal dominant face is not vertical, the measurement should be to the finished surface.

When determining the IDF, the surveyor should note that

- Skirting boards and decorative elements are not classified as part of the wall
- · Columns are ignored
- Window frames are deemed to form part of the window
- · Air conditioning units, ducting, bulkheads and cornices are ignored

COMPONENT AREAS

The sum of the total measured area in IPMS 2 - Office should be classified under separate component areas. There are eight categories of space (A to H) defining the type of space and facilities including structural elements, workspace, and hygiene areas.

LIMITED USE AREAS

In some circumstances, it may be necessary for the surveyor to consider areas that are unsuitable for occupation such as areas with reduced height clearance or limited light. Such areas should be identified separately within IPMS reporting, with the limits to their occupation identified

IPMS 3 - OFFICE The floor area available on an exclusive basis to an occupier, but excluding standard facilities and shared circulation areas, and calculated on an occupier-by-occupier or floor-by-floor basis for each building

IPMS 3 - Office is for measuring the occupation of floor areas in exclusive use. IPMS 3 relates partially to **net internal area** (NIA).

Reported measurements include all internal walls and columns within an occupant's exclusive use.

- Floor area is taken to the internal dominant. face.
- · Where there is a common wall with an adjacent occupier, the centreline of the wall
- Boundaries, covered galleries and rooftop terraces in exclusive use are measured to the inner face and their areas are stated separately.

STANDARD FACILITIES

Standard facilities are parts of the building providing shared or common facilities and should be excluded from IPMS 3 - Office measurements. Examples of shared facilities include toilets, plant rooms, stairs, lifts. cleaner's cupboards, and fire refuge areas.
